Chris,

I just tried to give you a quick call, but didn't leave a voicemail. I'm looking over the application for the 3 ARAPs. With regard to the triple box road crossing, I'm a little confused on the detail. It looks like the flow (based on TOB) is only being directed through one of the boxes – is this one of the reaches where the width of the channel is only about 12'? Is there realignment proposed? I understand flow will be diverted while boxes are constructed, but the box/wing wall orientation doesn't appear to line up with natural stream flow. I may be misunderstanding. Thanks,
