Re: Construction Compliance Inspection

October 12, 2011
Environmental Waste Solutions
IDL 03-0212

Dear Mr. Sohr:

On October 10, 2011, Mr. Ronald Potts, Environmental Protection Specialist, Division of Solid Waste Management, conducted a construction compliance inspection of the Environmental Waste Solutions Industrial Landfill IDL 03-0212 located on Omar Circle in Camden, Tennessee. At the time of the inspection, Mr. Potts noted the facility specific Permit Condition Number 10 had not been complied with.

Facility Specific Permit Condition Number 10 states, "Upon Achieving the base grade of excavation for each phase, the permittee shall notify the Division of Solid Waste Management (Division). The Division shall inspect the base grade for soft spots, wet zones, bedrock, and voids prior to buffer liner construction. The Division may require further investigation if such conditions are encountered."

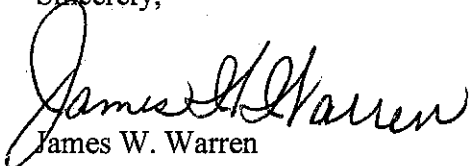

At the time of the October 10, 2011 construction of Phase 3, Cell 1 had progressed to the point that the sub-grade exposed was the top of constructed clay liner/ buffer and the proceeding phase of construction was placement of the flexible membrane liner component of the liner system.

Mr. Scott T. Sohr

Page 2

This deficiency was brought to your attention and was further discussed with Mr. Jo House, Engineer of Record for the construction project, and permitting staff in the Division's Nashville Central Office. Mr. House subsequently submitted a quality assurance document to the division on October 18, 2011. The Quality Assurance Document detailed efforts taken to ensure the geologic buffer and clay liner components of the composite liner system were constructed according to the permit requirements for the facility.

If you have any questions concerning this letter, please contact me at (731) 512-1337.

Sincerely,
